

TRUE Asynchronous USB or SD/Micro SD flash Duplication

A common problem found with existing USB or SD duplicators is their limitations with asynchronous copying. Typically these systems are restricted by the size of the file (typically anything larger than 128MB) or suffer from repetitive freezing or failures.

Vinpower Digital has found a unique patent pending method that not only allows the user to perform asynchronous copies at maximum duplication speed, but also is not restricted by the size of the file being copied. Whether the user is copying 20MB or 64GB, the system will allow for asynchronous duplication without issue.
